This guide presents a unified approach to the design of structural steel members with web openings. The approach is based on strength criteria rather than allowable stresses, because at working loads, locally high stresses around web openings have little connection with a member's deflection or strength.

Design aids compatible with the Load and Resistance Factor Design Specification for Structural Steel Buildings were obtained from computational analyses based on AISC Design Guide No. 2 to facilitate the design of openings in webs of steel and composite beams with W-shapes. The set of design aids presented allow identification of the ""neutral zone"", a region in the beam web in which openings with some particular characteristics do not reduce the beam strength.

Design guidance was given in an earlier SCI publication, Design for openings in webs of composite beams (P068) and design issues were further explored within a European Coal and Steel Community project, Large web openings for service integration in composite floors (ECSC project reference 7210-PR-315) and a Research Fund for Coal and Steel valorisation project (RFCS Project RFS-C2-05037).

Design of Composite Beams with Large web openings

The design of web openings has historically consisted of the construction of a moment-shear interaction diagram of the type illustrated in Fig. 5.8. Models have been developed to generate the moment-shear diagrams point by point (Aglan & Qaqish 1982, Clawson & Darwin 1983, Donahey & Darwin 1986, Poubouras 1983, Todd & Cooper 1980, Wang et al. 1975).
