Rapid and accurate diagnosis and evaluation of cerebrovascular diseases are of great importance to reduce the incidence, morbidity and mortality of cerebrovascular diseases. With the rapid development of medical ultrasound, the clinical relationship between ultrasound imaging technology and the diagnosis and treatment of cerebrovascular diseases has become increasingly close.

Duplex ultrasound can accurately evaluate atherothrombotic changes in internal carotid artery (ICA), including characterization of the plaque, stenosis gradation, and occlusion diagnosis. Further, extracranial ultrasound can be helpful for ICA stenting and endarterectomy surveillance as well as for evaluation of VA stenosis and occlusion, subclavian steal phenomenon, and both carotid and VA dissections.
